

Concept of Pipes

Transform data before output in template ("format")

• Grammar:

```
    {{ flight.from | city:\short' }}
    {{ flight.from | city:\short':\en' }}
    {{ flight.from | city:\short':\en' | uppercase }}
```

Build-in Pipes

DatePipe UpperCasePipe LowerCasePipe DecimalPipe

CurrencyPipe PercentPipe JsonPipe AsyncPipe

Pure Pipes

Output depends only on input parameters

• Benefit: performance can be optimized

Declaration of a pipe

```
import { Pipe, PipeTransform } from '@angular/core';
@Pipe({
    name: 'city',
    pure: true
})
export class CityPipe implements PipeTransform {
       transform(value: any, param1: any, param2: any, ...): any {
               [...]
             return [...];
```

Register the pipe in a module

```
@NgModule({
    imports: [
        BrowserModule, HttpModule, FormsModule
    ],
    declarations: [
        AppComponent, FlightSearchComponent, CityPipe
    ],
    bootstrap: [
        AppComponent
    ]
})
export class AppModule {}
```
